

Witty Health ([www.wittyhealth.com](http://www.wittyhealth.com)) is a health risk monitoring software platform that provides real-time visibility of an individual's health risks to providers.

The Witty Health value-based platform includes four software modules. It can be used in both hospital and home health settings

**Patient Examination Module:**

Patients at a physician's office can be remotely examined by the physician from home. RN can help upload real-time device data

**Telemedicine Module:**

Patients can consult one or more physicians and specialists at different remote locations via video from the comfort of their homes.

**Remote Monitoring Module:**

Connected with eight FDA approved devices: thermometer, glucose meter, pulse oximeter, BP cuff, ECG, stethoscope, camera to examine skin, ear, throat etc, and a wireless scale for real-time remote monitoring or upload for offline evaluation.

**Provider-Patient Messaging App:**

Witty Health Telemedicine is being upgraded with a simple iOS and Android Secured Messaging App to facilitate provider-patient communication. The module can be enhanced with a video conferencing feature as well as an option to auto connect medical devices. This is an additional module on-top of existing platform to facilitate patient engagement.

**a. Technical**

- The product can be branded and hosted on client's infrastructure.
- Witty Health product is adoptable to any EHR systems and to third party services such as e-prescribing.
- All the data generated on the platform can be pushed or pulled depending on client's IT infrastructure.

## b. Office Visits//Hospitalized Patient Management

Our device connected platform may help physicians to monitor patients who utilize EDs because of both acute and chronic health conditions

The screening module helps a Registered Nurse to connect multiple patients to one or more physicians and assist examinations with just one set of devices. Thus, physicians can monitor hospitalized patients remotely and receive notifications on their mobile devices, even when they are on the go or working from home.

The devices can be used live during a consultation with a physician or for uploading data offline for examination by physicians at a later time.

Using the Witty Health telemedicine solution, patients can consult UT Physicians via video conference from the comfort of their homes.

Patients can optionally buy their own set of devices and add them to their App for use while consulting physicians from their homes.

Physicians may also find value in using the Witty Health telemedicine platform in other areas of their acute care delivery, including hospital medicine services in internal medicine and behavioral health

## c. Ambulatory Applications:

The Witty Health remote monitoring, telemedicine and messaging app may find value in transit, intensive and chronic ambulatory cases.

### Chronic care:

The product can be used to help develop self-care skills for chronic patients in a community setting. It can be personalized according to the patient's condition, motivation and behavior as well as for survey replies and sending educational content.

### Transition care:

Clinicians can remotely monitor patients in their home and prioritize them for intervention to reduce readmissions through early detection of signs and symptoms. This in turn improves patient's quality-of-life and satisfaction through daily non-intrusive monitoring

### Intensive care:

Witty Health's 4-in-1 software solution may be customized to unite fractionalized care team members to provide concentrated and focused efforts to a small number of patients that utilize the majority of UT Health resources and funds.
